

I CLAIM

1. A device for securing and displaying cards, comprising i) a clip having a front side which has an inner surface, an outer surface and side edges, ii) a connector piece, iii) an intermediate securing piece secured to the clip, and iv) a carrier having a proximal end secured to the intermediate securing piece, wherein the intermediate securing piece is wider than the clip and is attached to the clip in such a way that a first piece of the connector piece is fastened to the inner surface of the front side of the clip and extends beyond the side edges of the clip, a second piece of the connector piece having a width equal to the width of the first piece of connector piece and the intermediate securing piece and having a length such that it will cover the outer surface of the front piece of the clip and extend distally to cover the intermediate securing piece and a portion of the carrier, is secured to the outer surface of the front side of the clip, the portions of the first piece of the connector piece which extend beyond the front side of the clip, the intermediate securing piece, and a proximal portion of the carrier.

2. The device of claim 1, wherein the carrier is a transparent plastic card carrier having a plurality of sheets, each sheet having a pocket therein for carrying at least one card.

3. The device of claim 1, wherein the attachment of the carrier to the intermediate securing piece includes an additional holding means.

4. The device of claim 1, wherein the intermediate securing piece is a sheet of such a size and shape as to accommodate visual information.

5. The device of claim 1, wherein the first piece of the connector piece and the second piece of the connector piece are attached to each other by adhesion, lamination, press-punch or hook-and-eye attachment means.
6. A device for securing and displaying cards, comprising i) a first clip having a front side which has an inner surface, an outer surface and side edges, ii) a second clip having a front side which has an inner surface, an outer surface and side edges, iii) a connector piece, and iv) an intermediate securing piece secured to the first clip and the second clip, wherein the intermediate securing piece is wider than the first and second clips and is attached to the clips in such a way that first pieces of the connector piece are fastened to the inner surfaces of the front sides of the first and second clips and extended beyond the side edges of the first and second clips, a second piece of the connector piece having a width equal to the width of the first pieces of connector piece and the intermediate securing piece and having a length such that it will cover the outer surface of the front piece of the first clip, the intermediate securing piece and the outer surface of the second clip is secured to the outer surfaces of the front sides of the first and second clips, the portions of the first piece of the connector piece which extend beyond the front side of the first and second clips and the intermediate securing piece.
7. The device of claim 6, wherein the intermediate securing piece is a sheet of such a size and shape as to accommodate visual information.
8. The device of claim 6, wherein the first piece of the connector piece and the second piece of the connector piece are attached to each other by adhesion, lamination, press-punch or hook-and-eye attachment means.

9. A device for securing and displaying cards, comprising i) a clip having a front side which has an inner surface, an outer surface and side edges, ii) a connector piece, and iii) a carrier having a proximal end secured to the clip, wherein the carrier is attached to the clip in such a way that a first piece of the connector piece is fastened to the inner surface of the front side of the clip and extends beyond the side edges of the clip, a second piece of the connector piece having a width equal to the width of the first piece of connector piece and having a length such that it will cover the outer surface of the front piece of the clip and extend distally to cover a portion of the carrier, is secured to the outer surface of the front side or the rear side of the clip, the portions of the first piece of the connector piece which extend beyond the front side of the clip, and a proximal portion of the carrier.

10. The device of claim 9, wherein the carrier is a transparent plastic card carrier having a plurality of sheets, each sheet having a pocket therein for carrying at least one card.

11. The device of claim 9, wherein the first piece of the connector piece and the second piece of the connector piece are attached to each other by adhesion, lamination, press-punch or hook-and-eye attachment means.
